WEEK-2 SKILL

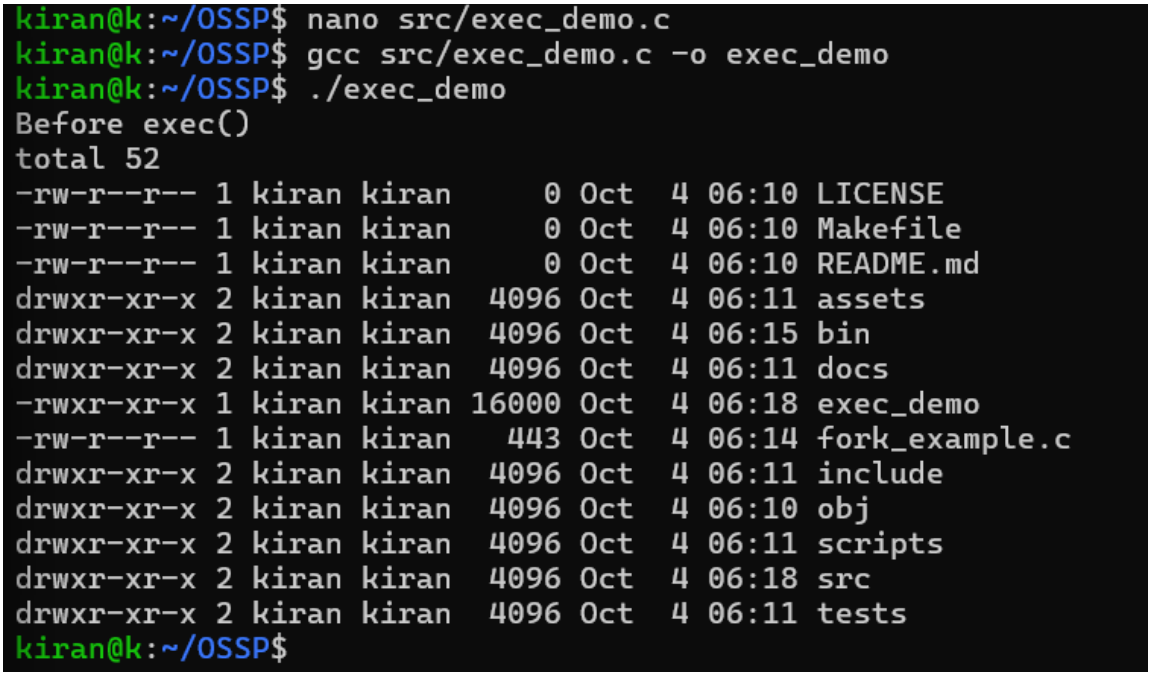

1. **To Install Linux VM, Configure GCC, Setup Git Repository, Create Project Structure, Understand Shell Architecture, Build Initial Makefile.**

```

9 directories, 19 files
kiran@k:~/OSSP$
```

kiran@k: ~/OSSP
GNU nano 8.7.1 fork_example.c *
#include <stdio.h>
#include <unistd.h>
int main() {
pid_t pid;
pid = fork();
if (pid < 0) {
printf("Fork failed!\n");
}
else if (pid == 0) {
printf("This is the Child Process.\n");
printf("Child PID = %d\n", getpid());
}
else {
printf("This is the Parent Process.\n");
printf("Parent PID = %d\n", getpid());
printf("Child PID = %d\n", pid);
}
return 0;
}

OUTPUT:

REPORT: I successfully installed the Linux environment and configured the GCC compiler. I created a Git repository and organized the required project folders and files. I also understood the basic shell architecture and created a simple Make file to build the project.

1. **To Analyze process abstraction, execute fork(), understand exec() family, analyze parentchild relationships, inspect process tree, practice system call tracing.**

GNU nano 8.7.1 fork_example.c

```c
#include <stdio.h>
#include <unistd.h>

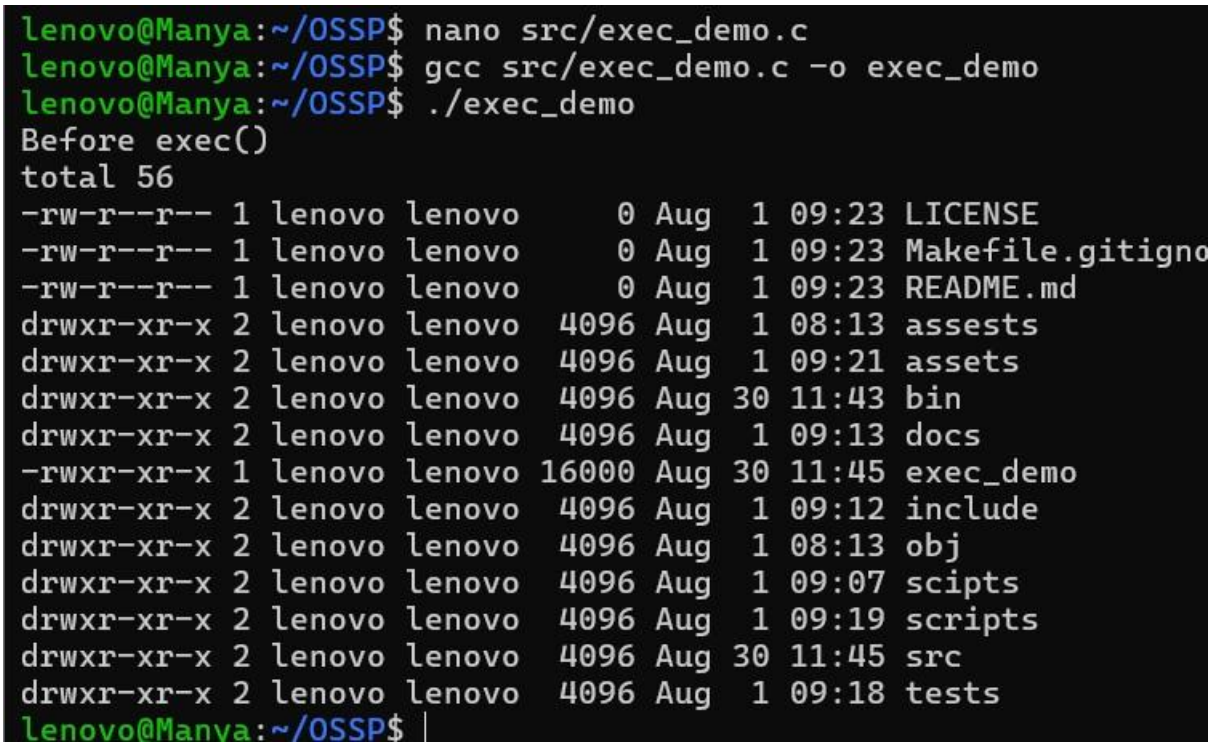

int main() {
    pid_t pid;

    pid = fork();

    if (pid < 0) {
        printf("Fork failed!\n");
    }
    else if (pid == 0) {
        printf("This is the Child Process.\n");
        printf("Child PID = %d\n", getpid());
    }
    else {
        printf("This is the Parent Process.\n");
        printf("Parent PID = %d\n", getpid());
        printf("Child PID = %d\n", pid);
    }

    return 0;
}
```

OUTPUT:

REPORT: I executed the fork() program and observed how a parent process creates a child process. I understood the working of the exec() family and learned how processes are replaced during execution. I also examined the process tree and practiced tracing system calls to understand how a program interacts with the operating system.
